

# AP CALCULUS

## CREATE THE QUIZ

WE BEGIN OUR STORY  
IN NEW YORK

- 1 Find the derivative of  $\ln|\cos \sqrt{x-13}|$ .

- A.  $-\tan \sqrt{x-13} / 2\sqrt{x-13}$
- B.  $\sin \sqrt{x-13} \sec \sqrt{x-13} / 2\sqrt{x-13}$
- C.  $-\tan \sqrt{x-13}$
- D.  $\sec \sqrt{x-13} / 2\sqrt{x-13}$

- 3 Let  $f(x) = (e^x + e^{-x} + 2) / (e^x + 1)$ . What is  $f'(x)$ ?

- A.  $e^x - 2e^{-x}$
- B.  $e^{-x}$
- C.  $-e^x$
- D.  $-e^{-x}$

- 4 Apple Music released the 1989 Tour Movie on Dec. 20. Normally, the rate (streams/day) that swifties stream the movie can be modeled by

$S(t) = 600e^{-x/70} + \cos(2/7 \pi x) + 1$ , where  $t$  is the number of days since the release. This model **does not work for the holiday period** from Dec. 20 to Jan. 3 ( $t = [0, 14]$ ), but Apple's servers counted 22,000 streams during this interval. Using **calculus**, **which is then the** best prediction for the total number of streams the 1989 Movie will have by May 8th ( $t = 140$ )?

- A.  $42,000/\sqrt[5]{e} - 42,000/e^2 + 126$
- B.  $42,000/\sqrt[5]{e} - 42,000/e^2 + 22126$
- C.  $42,000/\sqrt[5]{e} - 42,000/e^2 + 140$
- D.  $-42000/e^2 + 7/2\pi \sin(40\pi) + 140$

**Correct answer: B**

$$\int S(t) = -42000e^{-x/70} + 7/2\pi \sin(2/7 \pi x) + x + c$$

$$\int_0^{14} S(t) = 22000$$

$$\begin{aligned} \int_{14}^{140} S(t) &= (-42000/e^2 + 7/2\pi \sin(40\pi) + 140) - \\ &\quad (-42,000/\sqrt[5]{e} + 7/2\pi \sin(4\pi) + 14) \\ &= 42,000/\sqrt[5]{e} - 42,000/e^2 + 126 \end{aligned}$$

$$\begin{aligned} \int_0^{140} S(t) &= \int_0^{14} S(t) + \int_{14}^{140} S(t) \\ &= 22000 + 42,000/\sqrt[5]{e} - 42,000/e^2 + 126 \\ &= 42,000/\sqrt[5]{e} - 42,000/e^2 + 22126 \end{aligned}$$
